

System V

Hycrete has made available its System V, which combines hydrophobic concrete admixtures and field service to protect flooring and building interiors from moisture- and vapor-related problems. Moisture in concrete has emerged as a leading cause of flooring failures and litigation in construction. System V is a full-performance warranty against moisture- and vapor-related flooring failures.

Highlights

- No VOCs
- Flooring can be installed after 28 days of concrete placement with no fear of failure, accelerating construction schedules.
- Hycrete W1000 admixture (a component of System V) keeps water out of concrete by shutting down capillary absorption; the drying clock is not re-set and flooring can be installed as scheduled.
- System V is ideal for below- or on-grade slabs where flooring is being installed, as well as for suspended slabs where there is concern of concrete re-wetting after placement.
- Specific applications include hospitals, schools, office buildings and multifamily structures.
